

Financial Reconciliation Agent

What was available before this agent came into picture?

D365 FO provided SSRS reports that allowed reconciliation between subledger and ledger balances. However, running these reports, reviewing each entry for discrepancies, and posting the differences was a time-consuming and labor-intensive process. To simplify and enhance this workflow, Microsoft introduced Finance Reconciliation Agents.

Vendor/Ledger reconciliation

Contoso Entertainment System USA

6:21 AM

Main account	Name	Vendor balance	Ledger balance	Difference
200110	Accounts Payable - Other	-100.00	-100.00	0.00
Total		-100.00	-100.00	0.00

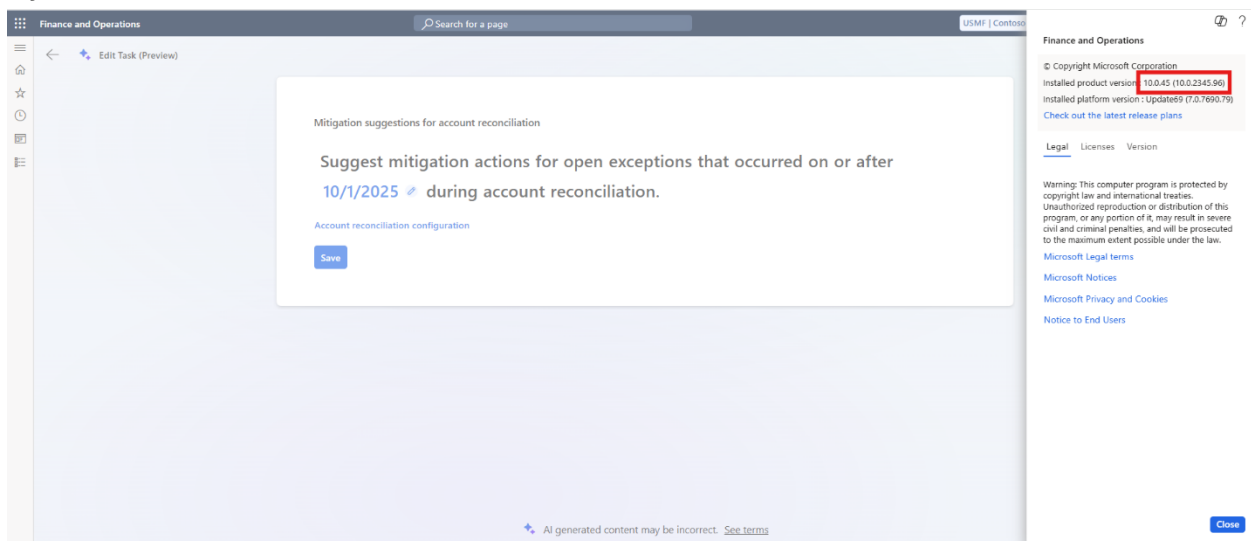

Primary reason for Reconciliation Issues

1. Manual entry allowed on the posting profile accounts
2. One ledger account is mapped to multiple subledger accounts
3. Changes made to posting profiles frequently

Setting up the Agent

Prerequisites to consider

1. Dynamics 365 Finance version 10.0.44 or later.

In the Feature management the following features must be enabled:

- Immersive Home
- Agent Management
- Account reconciliation agent

Feature name	Status	Enable date	Feature added	Feature state	Module
(Production Ready Preview) Account reconciliation agent	✓	11/4/2025	7/27/2025	Preview	General ledger

This feature was enabled on 11/4/2025

Description
The account reconciliation agent reconciles subledgers to the general ledger balances. This agent identifies mismatched transactions and suggests a solution. That solution may be changing a setting or may recognize when a posting profile has changed, causing a different balance sheet account to be used for reconciliation. An audit trail will be maintained when issues are identified, along with the solution. The agent will learn from the solutions of the past and will assist with resolution of reconciliation issues.

Comments

[Disable](#)

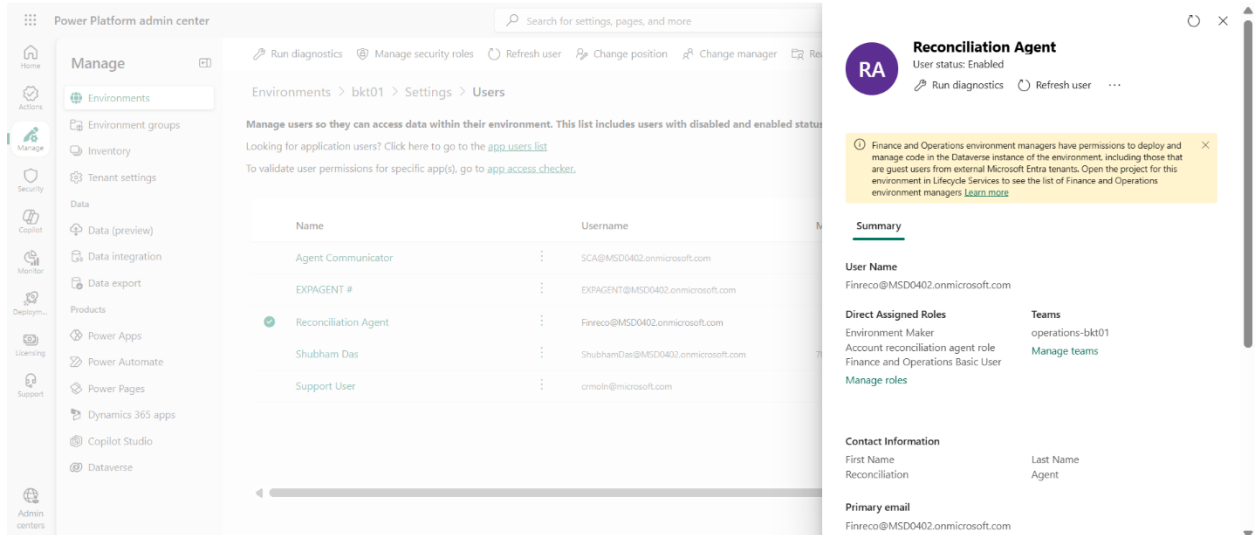

2. In the Power Platform admin center, the apps below must be running at their latest version

- Copilot for finance and operations apps
- Copilot in Microsoft Dynamics 365 Finance

3. The agent user must be created in Dataverse and D365FO assigned the below roles

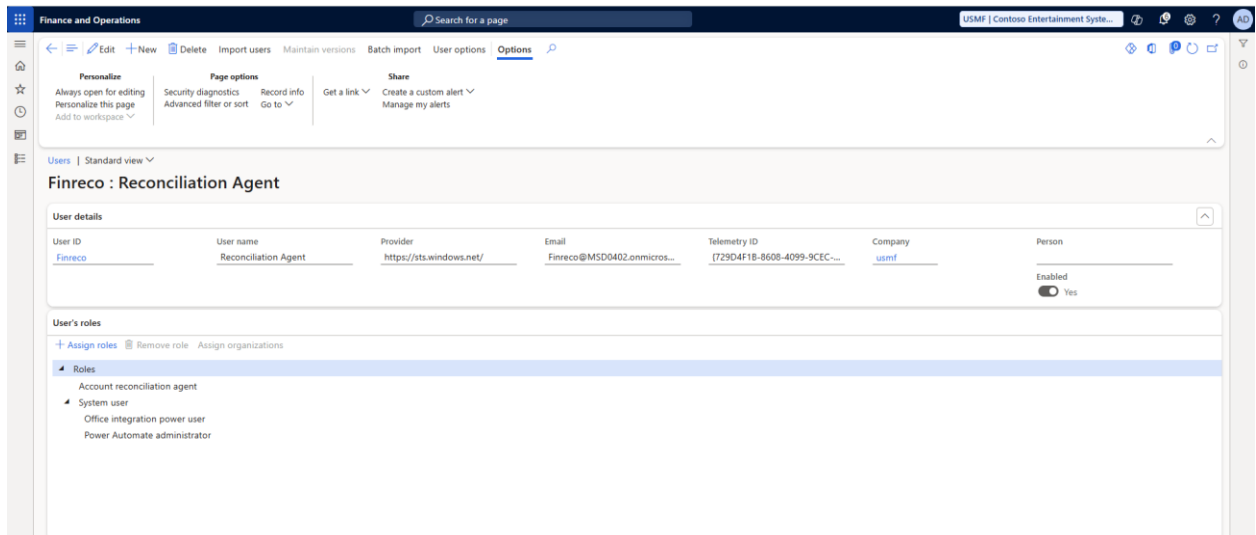

Required Dataverse user roles

- Finance and Operations basic user
- Account reconciliation agent role
- Environment maker

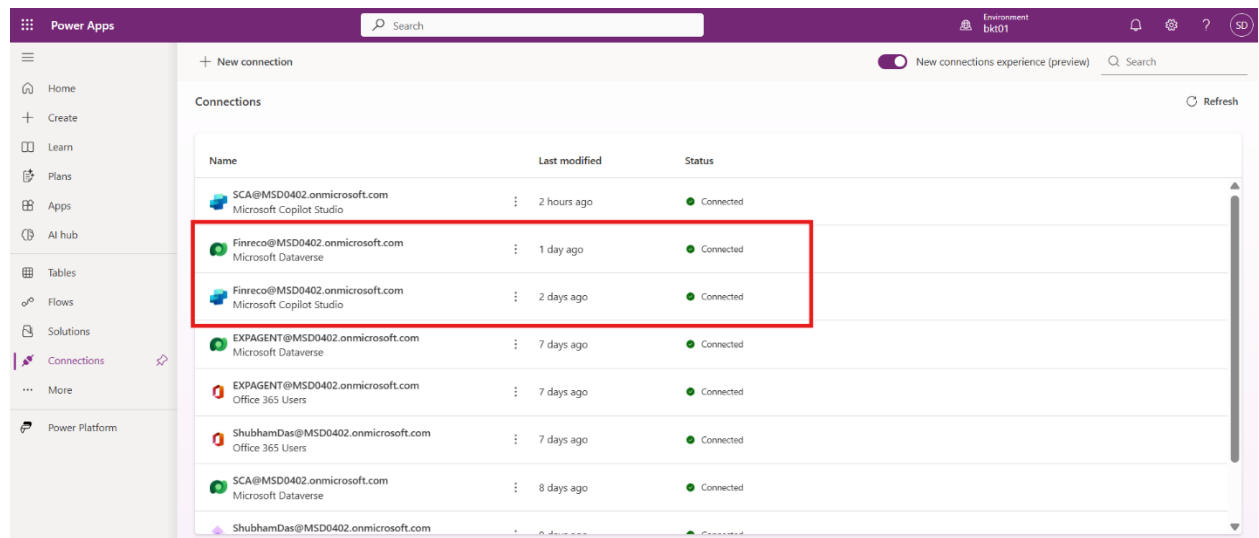

Required D365 FO user roles

- Accounts reconciliation agent role
- System User

- To enable the agent to access business data and make certain decisions, it must be connected to Dataverse and Copilot Studio using the agent's identity. These connections can be configured by logging into the Power Apps portal with the environment administrator account and creating the connections as illustrated

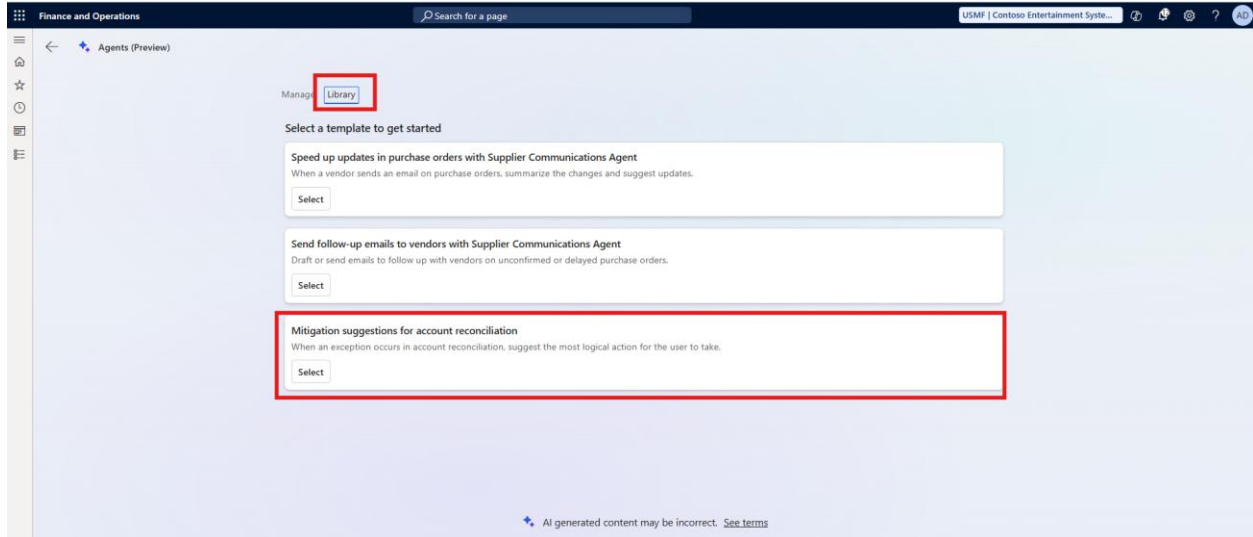

below.

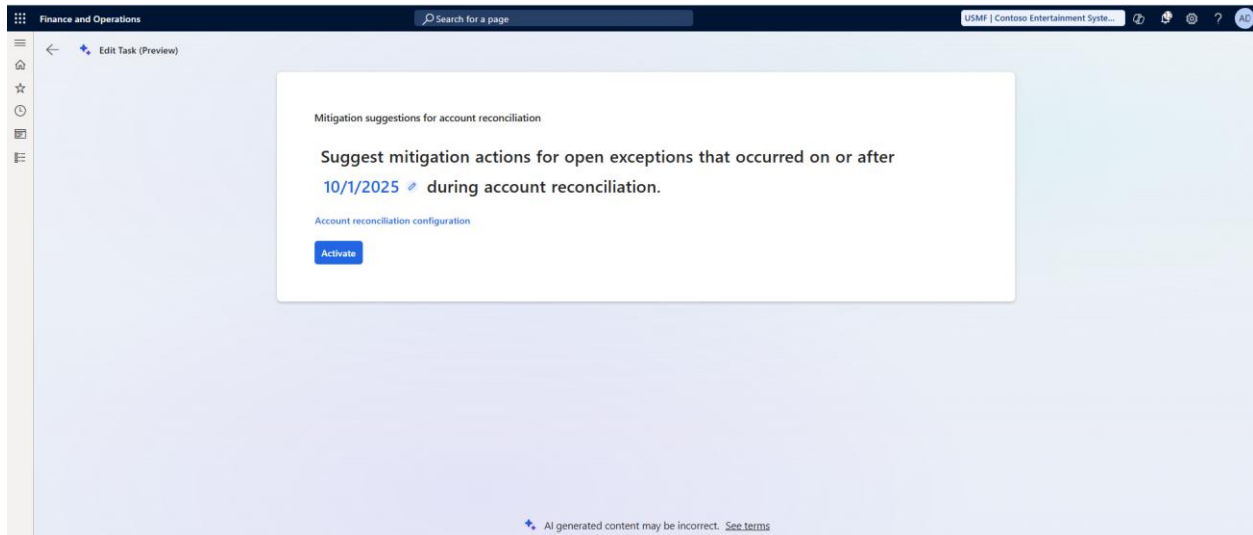

5. Once the connections are created, they must be set as references for the specific flows and actions that the agent will trigger using its identity. A PowerShell script is provided to update these references, which requires the Dataverse environment ID, URL, and connection details for DV (Dataverse) and MCS (Microsoft Copilot Studio). The link to the script is provided below. When running the script, use the environment administrator credentials whenever prompted to log in <https://learn.microsoft.com/en-us/dynamics365/finance/general-ledger/configure-acct-recon-agent>

Enabling the Agent in D365 FO

Navigate to Agents > Agents (preview), select the library tab and then select Mitigation suggestions for account reconciliation.

Before activating, setup the Account reconciliation configuration

Account reconciliation configuration

This includes the ledger accounts mapped to the subledger accounts for Vendors, Customers, Banks, and Taxes. In other words, these are posting profiles and do not require manual updates. Any new posting profiles created for Vendors, Customers, Banks, or Taxes are automatically reflected here.

This displays exceptions where the ledger and subledger entries are not reconciled. For example, the voucher number is shown when an entry exists in the subledger but is missing in the ledger

The highlighted tab shows the details of this transaction in the subledger (AP) and the corresponding ledger entry. Since the transaction exists in the subledger but not in the ledger, there are only three possible ways to reconcile it.

1. Create a Journal entry

Once we place the reason and click on Ok, the GL transaction page will open. The transaction needs to be created manually and posted to reconcile the same.

Trivia

How is the entry in subledger but not in Ledger?

Please refer to the screenshot below

Table restrictions

Allow automatic settlement Close

Yes

The Invoice register has been posted which has hit the arrival account and offset the offset account. The arrival account is also a posting profile account. The Same transaction has not hit the summary account till now. Hence, this transaction exists in the subledger but not in ledger. The Journal entry to be posted here would be

Arrival **Dr** and Summary account **Cr**

Unreconciled transaction link type Related

Link transactions Close

The transactions available in Subledger but not in Ledger can be linked with transactions available in Ledger and not in Subledger to mitigate the exceptions.

The addressed exception tab will show both the transaction and the reason we have given for linking these transactions.

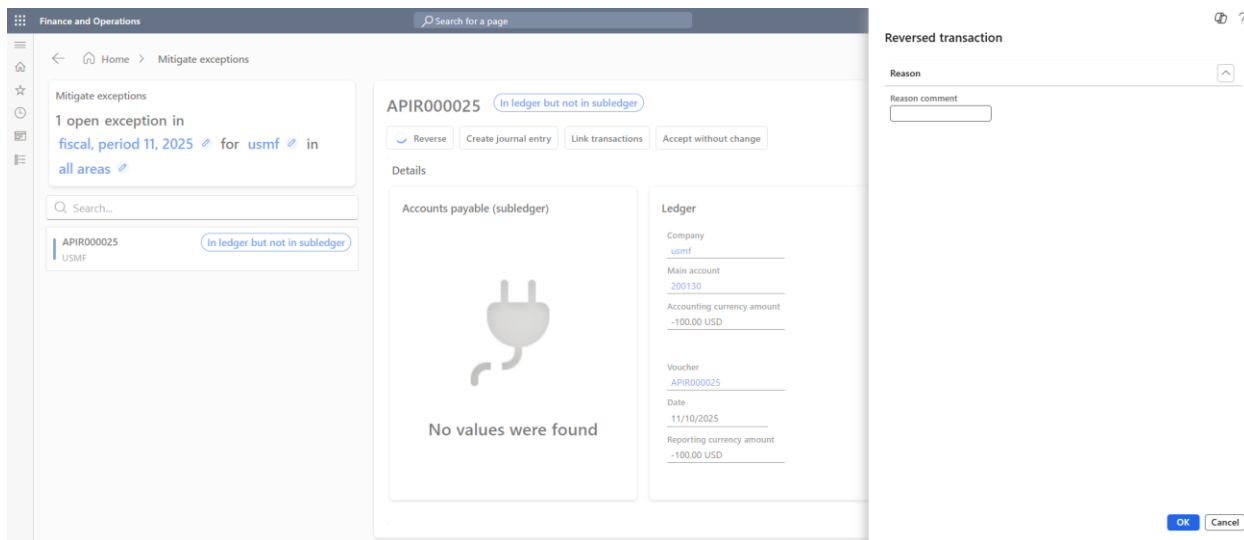

3. Accept without changes

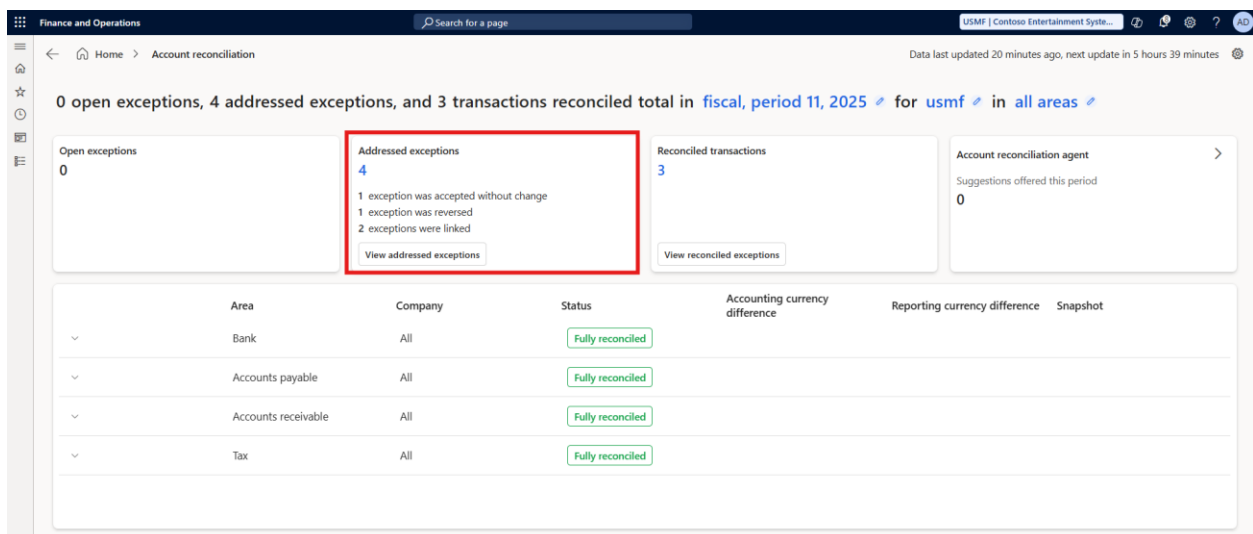

If we do not want to have any adjustments and linking, we can exclude these transactions from our reconciliation but selecting the Accept without changes and giving the reason for the same.

4. Reverse (Only applicable, if transaction exists in ledger but not in subledger)

A reversal of the original journal can be posted in this case

Once all the exceptions are mitigated, the reconciliation summary will show all the transactions which will include reconciled transactions and addressed exceptions.

Account reconciliation agent

This tab provides suggestions from the agent to resolve the exception. The recommended action will be one of the four options explained above. However, users can investigate further and choose to perform any of the mitigation actions.
