

General Ledger & Account Structures in D365 F&O

The **General Ledger** serves as the foundation for recording the financial transactions of a legal entity. It captures all financial entries using the main accounts defined within the **Chart of Accounts**, ensuring structured and compliant financial reporting.

An **Account Structure** defines the configuration and rules that determine how transactions are posted to the General Ledger. It specifies the required combination of **main accounts and financial dimensions**, ensuring consistency, control, and accuracy in financial postings.

Together, these elements form the backbone of financial governance within Dynamics 365 Finance & Operations.

Click on NEW and fill the account structure and description:

The current status is **Draft**.

The **Main Account** segment is already included in the structure since the “Add main account” option is enabled. Within the main account field, a specific range of accounts can be defined.

By selecting **Add Segment**, additional financial dimensions can be incorporated, allowing you to establish rules that apply to the selected main account range. This ensures controlled and structured posting logic within the account structure configuration.

In this setup, two financial dimensions — **Project** and **Service Line** — have been added for the main account range **400000–999999**. This means that whenever a transaction is posted using any main account within this range, the system will automatically prompt for the Project and Service Line dimensions.

It is important to understand the symbols used when configuring account structures. The “+” symbol makes a dimension mandatory, requiring a value during posting, while the “*” symbol makes it optional, allowing the field to remain blank.

Careful consideration is essential before activating the account structure to ensure proper financial control and reporting accuracy.

The screenshot shows the 'Allowed value details' configuration for the 'Project' dimension. The 'Blank values are allowed' checkbox is checked. Below the checkbox are buttons for 'Apply', 'Revert', and 'Clear all'. The 'Where' dropdown is set to 'Project', and the 'Operator' dropdown is set to 'is like'. The 'Value' field is empty. A '+ Add new criteria' link is visible at the bottom left.

In below section we can define criteria of the account structure:

The screenshot shows the 'Service Industries P&L' account structure configuration. The 'Allowed value details' section has the 'Blank values are allowed' checkbox unchecked. The 'Where' dropdown is set to 'MainAccount'. The 'Operator' dropdown is set to 'is between and includes'. The 'Value' field is set to '400000' and the 'through' field is set to '999999'. A dropdown menu is open showing various operators: 'is between and includes', 'is between', 'is greater than and includes', 'is greater than', 'is less than and includes', 'is less than', and 'is like'. The 'is between and includes' operator is selected. A 'View activation status' link is visible in the top right corner.

After these steps we will validate and activate the Account Structure

The account structure is activated

There is an additional configuration option within account structures known as **Advanced Rules**.

Advanced Rules are used when additional financial dimension segments need to be applied to specific main accounts or a defined range of main accounts. Instead of modifying the entire account structure, you can create an advanced rule and assign it only to the relevant accounts.

This approach allows for more precise control, ensuring that extra dimensions are required only where necessary, while keeping the overall account structure clean and efficient.

In this configuration, an **Advanced Rule** has been defined where the **Retail Channel** and **Worker** dimensions are optional and can remain blank, while the **Terminal** dimension is mandatory and must be populated during posting.

The current status of this advanced rule is **Draft**, meaning it has been configured but not yet activated.

Now we will Validate and activate the advance rule

Once the **Advanced Rule** is activated, the next step is to return to the **Configure Account Structure** form to integrate and apply the rule within the defined account structure.

To proceed with further configuration, we will change the status of the existing **Account Structure** from *Active* back to *Draft* by selecting the **Edit** option. This allows modifications to be made before reactivating the structure.

Following this step, we will review and validate the configured **Advanced Rules** to ensure they are correctly aligned with the account structure requirements before final activation.

The Advanced Rule is now applied to main account **400005**. As a result, whenever this main account is used in a journal line, the system will prompt for the configured financial dimensions.

Based on the rule setup, the **Retail Channel** and **Worker** dimensions are optional and may remain blank, while the **Terminal** dimension is mandatory and must be entered before posting.

This ensures controlled and accurate financial data entry aligned with the defined configuration.

After incorporating the Advanced Rule into the Account Structure, the structure must be reactivated, as its status was previously changed from *Active* to *Draft* to allow modifications.

Once the Account Structure is finalized and linked to the relevant main accounts, the final step is to associate it with the **Ledger** to ensure it is enforced during financial postings.

By assigning the **Account Structure** within the Ledger setup, the system enforces validation rules on every financial transaction. This ensures that all postings comply with the defined main account and financial dimension requirements, maintaining accuracy and control in financial reporting.

One or more **Account Structures** can be assigned within the Ledger setup, allowing organizations to apply different validation rules based on specific main account groups or business requirements.
