

## Sales Order Confirmation Notification via Microsoft Teams

### Objective

Automate the process of notifying the Sales or Operations team when a **Sales Order** is marked as “**Confirmed**” in **Dynamics 365 Finance and Operations (D365 FO)** by sending a structured **Adaptive Card** to a Microsoft Teams channel. This enables timely awareness, collaboration, and downstream processing.

### Technical Overview

#### ✓ Trigger:

##### Dataverse - When a row is modified

- **Entity:** SalesOrderHeadersV2Entity (virtual entity for sales orders from D365 FO)
- **Scope:** Organization
- **Purpose:** Monitor changes to Sales Order status.

#### ✓ Condition:

Evaluate if the updated row has salesorderstatus = 200000001

This value corresponds to “**Confirmed**” in the Sales Order Status enumeration.

#### ✓ Downstream Actions (If Condition is True):

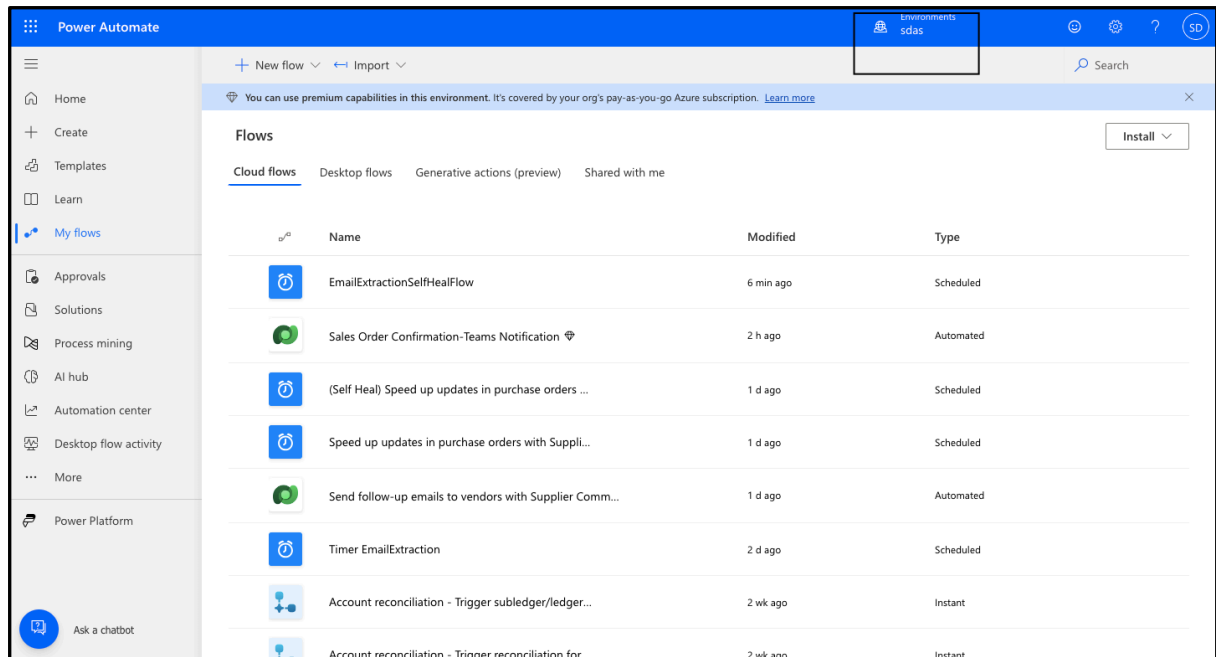

1. Retrieve full Sales Order details
2. Compose Adaptive Card JSON
3. Post the Adaptive Card to a Microsoft Teams channel using the Teams connector

### Pre-Requisites

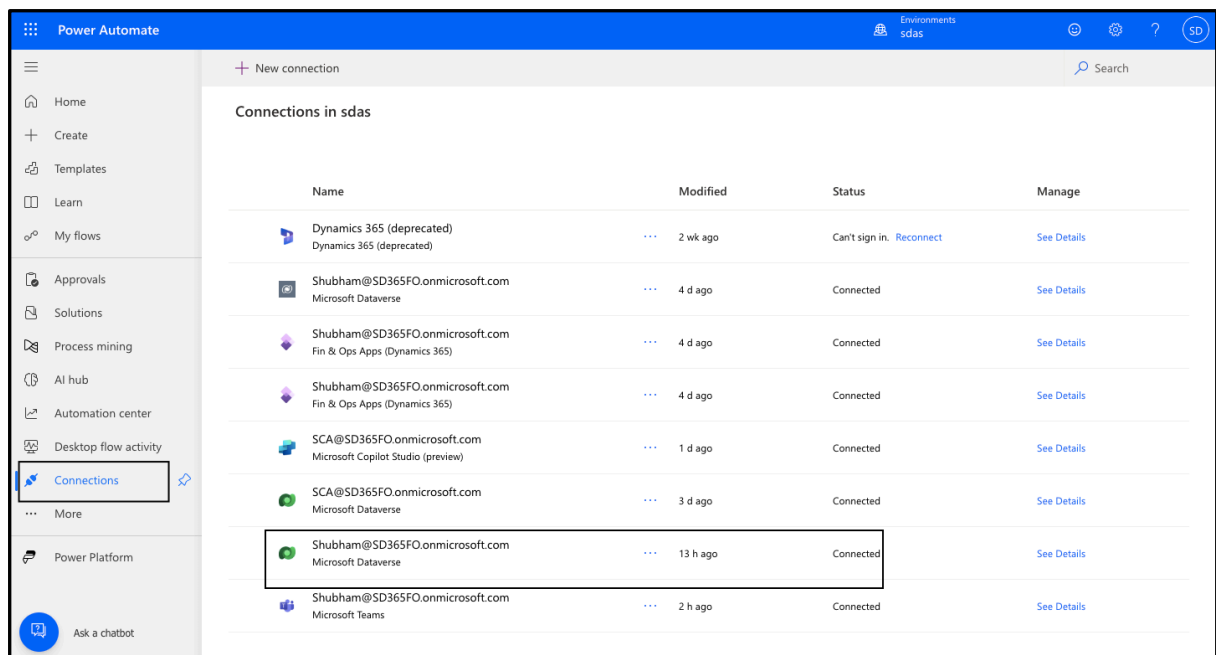

- Access to **Power Automate**
- Dataverse virtual entities for D365 FO are available ( SalesOrderHeadersV2Entity)
- Permissions to post messages to a Microsoft Teams channel

#### Steps: -

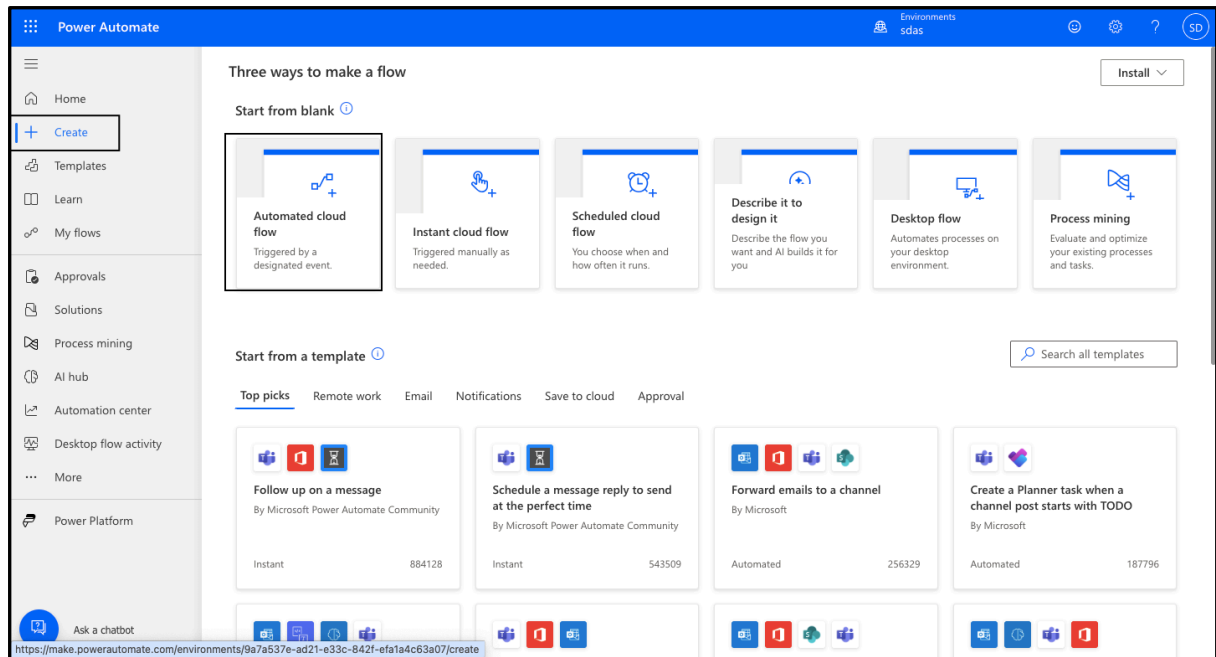

1. Log in to Power Automate to the same environment which is connected to D365 FO.

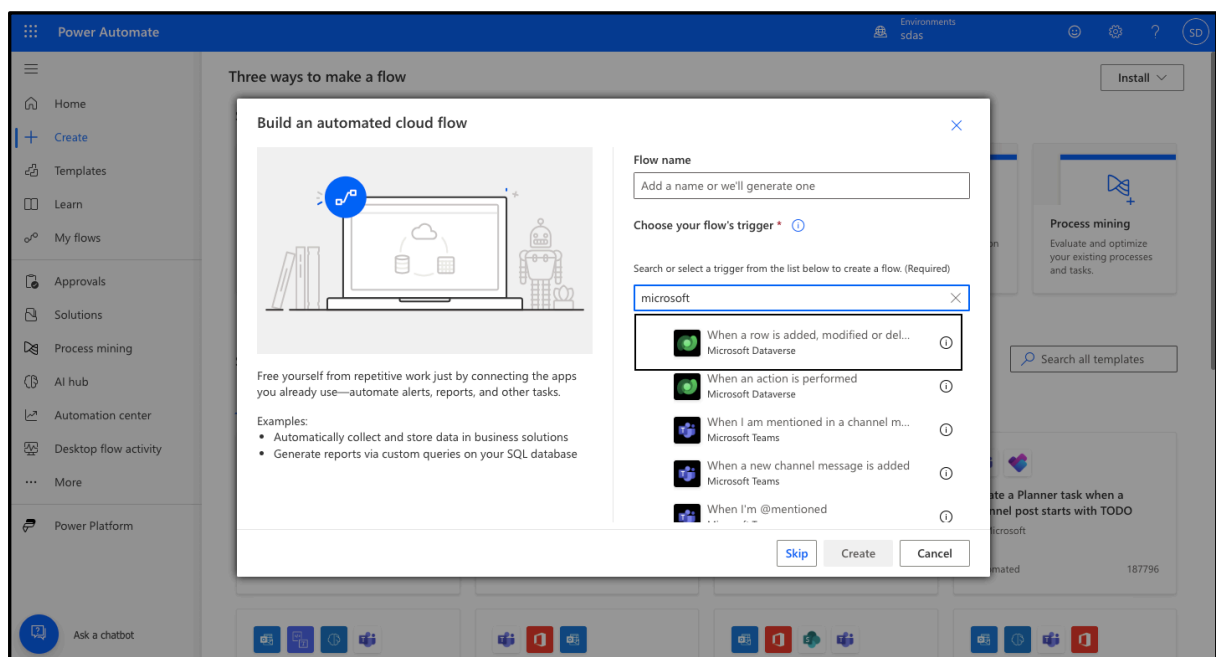

2. Navigate to connectors and check if the Dataverse connector exists

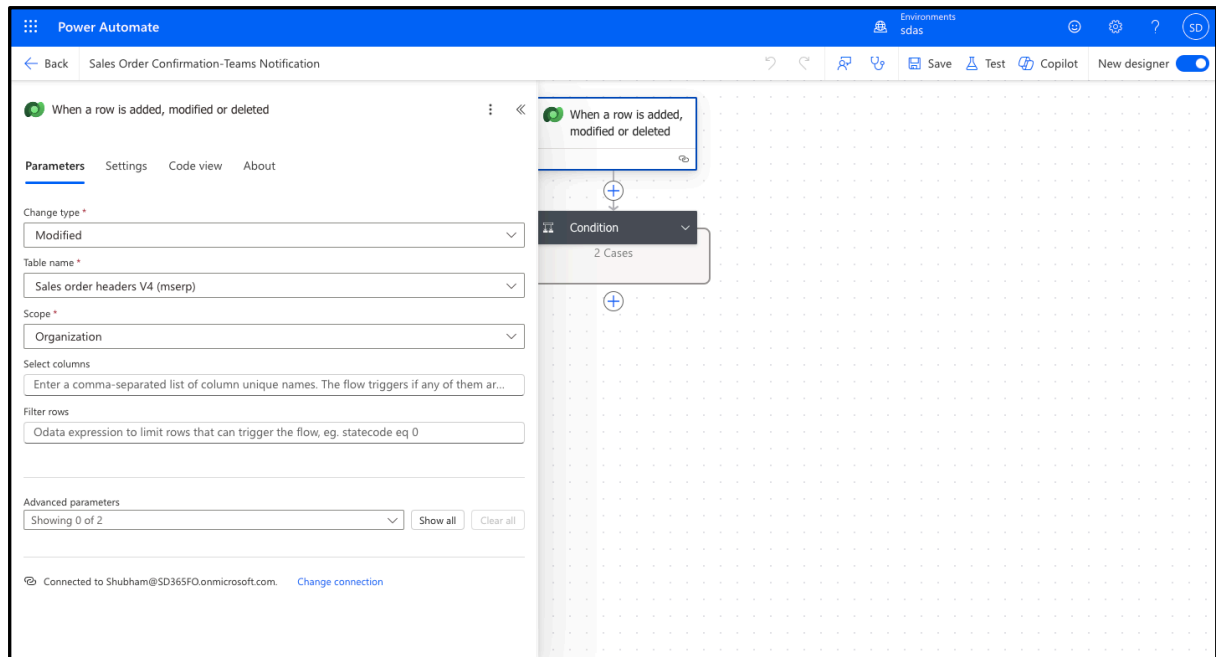

3. Click on create and select a New Automated cloud flow

4. Define a name for your flow and select the trigger as shown below

5. In the trigger select the parameters as shown below

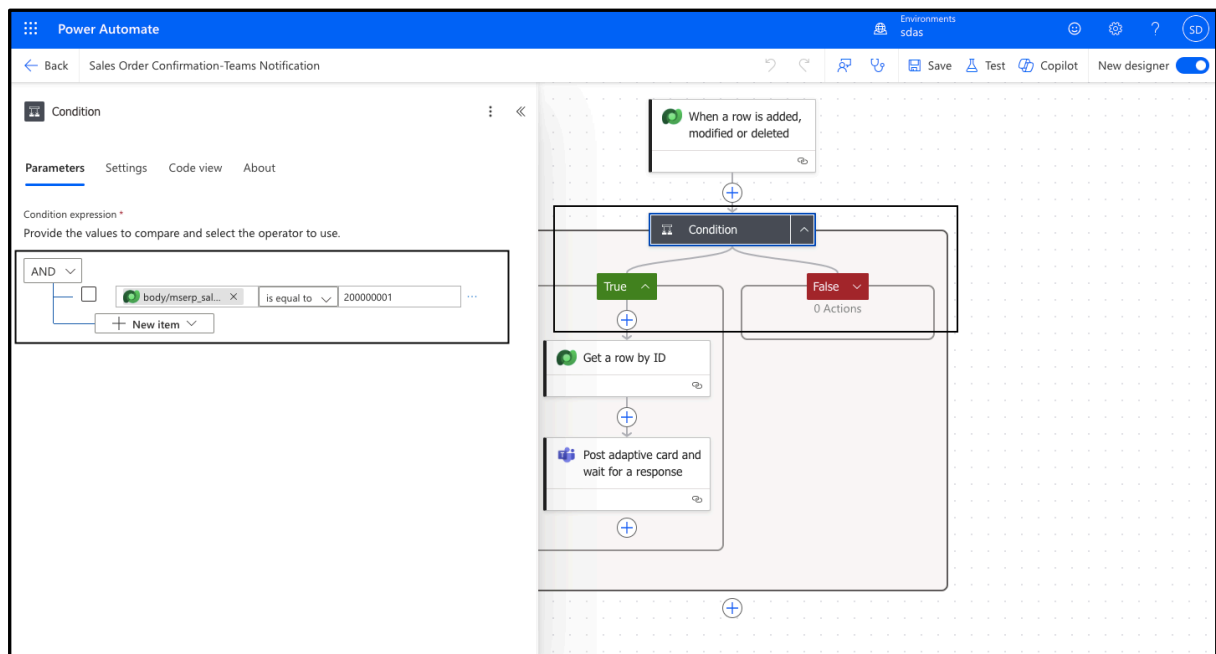

**Change type:** Modified (When the value of field is modified. In our case the value of SalesOrderStatus is being tracked. However, at this stage we are asking the flow to track on all fields of the table.

**Table:** The Virtual entity in the Dataverse (which corresponds to an D365 FO table)

**Scope:** Scope will always be organization

**Select columns:** This is kept blank. This means if any of the fields of this table is modified the flow will get triggered. At this stage we are not introducing a filter on the status, but this will drill down at the later stage of the flow when we define the condition.

Here we set the condition on the mserp\_salesorderstatus field which is the field used to track the Sales Order status. If the value of the same is 200000001.

## Common Enum Mappings for Sales Order Status

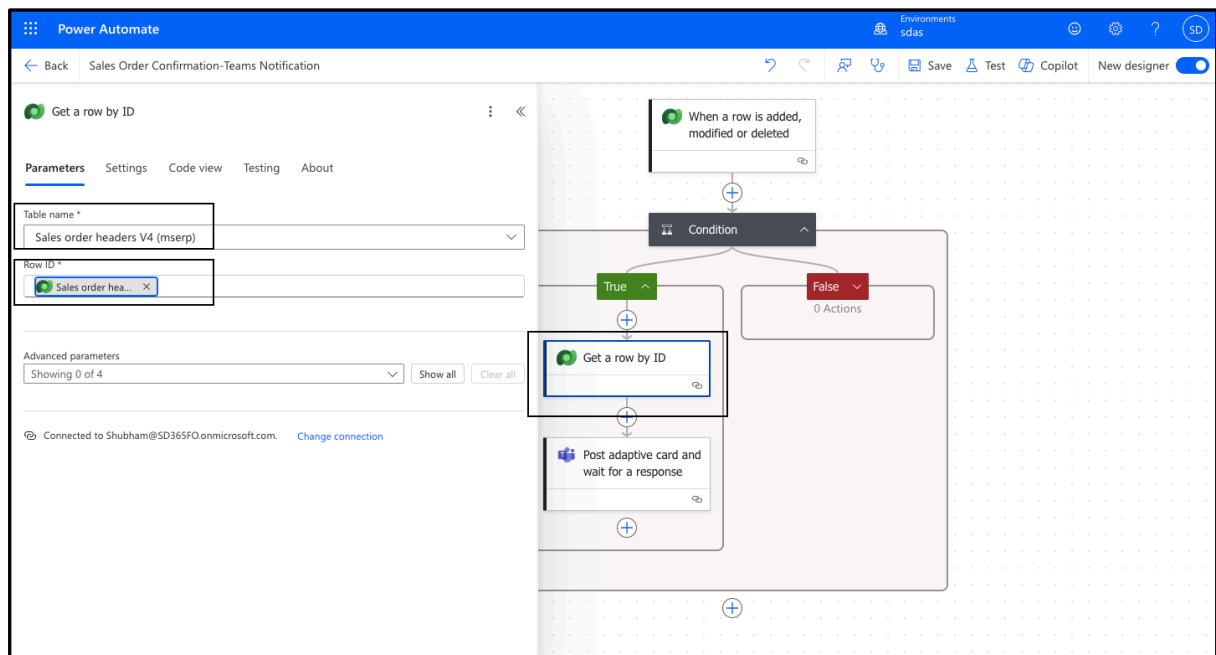

| Enum Value (Integer) | Status (Label)   |
|----------------------|------------------|
| 200000000            | Open Order       |
| 200000001            | <b>Confirmed</b> |
| 200000002            | Picked           |
| 200000003            | Packing Slip     |
| 200000004            | Invoiced         |
| 200000005            | Cancelled        |

If the condition is false, the flow will do nothing and stop.

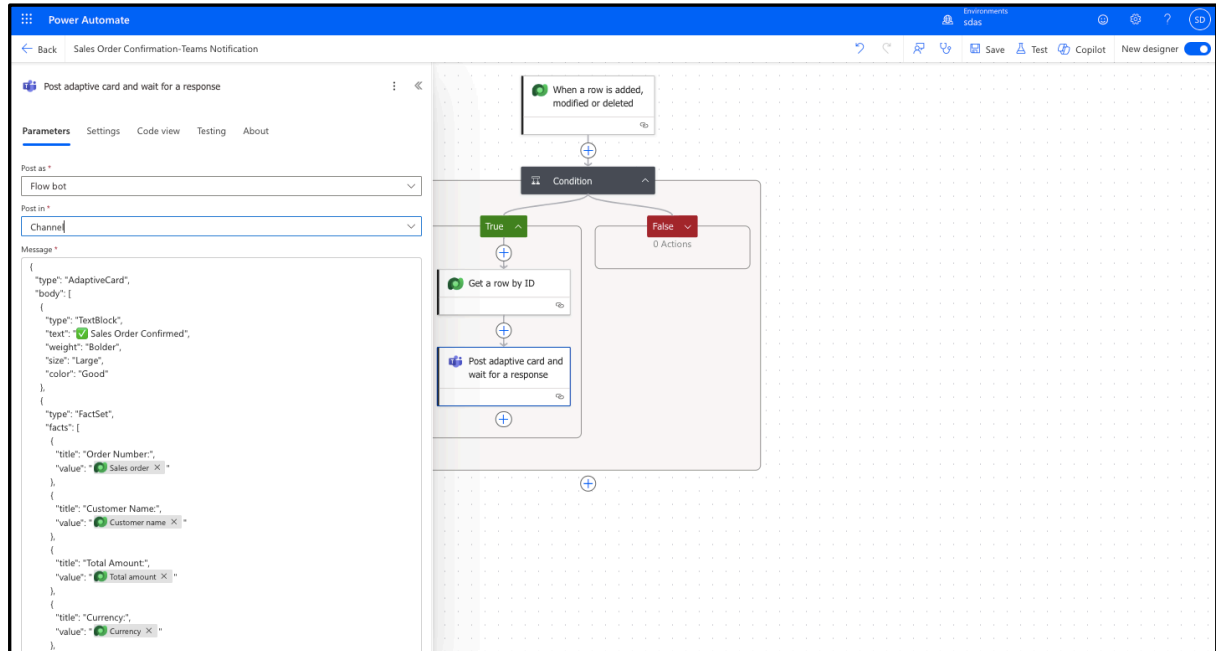

However, if the condition is true, it will trigger the unique primary key of the sales order header, which will later help us in extracting other details associated with the sales order. To do this we need to click on the + Icon and select the **Get a row by ID** as shown below.

The screenshot displays the Power Automate 'New flow' interface. On the left, a panel titled 'Add an action' shows a search bar with 'get a row by ID' entered. Below the search bar, a list of actions is categorized by connector: Microsoft Dataverse, Converter by Power2Apps, WPForms by Reenhanced LLC, and Oracle Database. The 'Microsoft Dataverse' category is expanded, showing actions like 'Get a row by ID from selected environment', 'Get a row by ID', 'Unrelate rows', 'Relate rows', 'List rows', 'Unrelate rows in selected environment', 'List rows from selected environment', and 'Update a row'. The 'Get a row by ID' action is highlighted. On the right, a flow diagram is visible, showing a sequence of steps: 'When a row is added, modified or deleted' (trigger), followed by a 'Condition' step. The 'Condition' step has two paths: 'True' (green) and 'False' (red). The 'True' path leads to another 'Get a row by ID' action, followed by a 'Post adaptive card and wait for a response' action. The 'False' path leads to a box labeled '0 Actions'.

Once selected, we need to define the Table name where these changes have been tracked (which is the same sales table (Sales Order headers V4) and the primary key/GUID of the same which is mserp\_salesorderheaderv4entityid)

Using these details, we can extract the other details of the Sales Order which can then be posted to a specific channel (which we create for sales purpose) of teams.

In the message section we need to put the JSON file. Attaching the same for reference.

{  
"type": "AdaptiveCard",  
}

Message is of Type Adaptive card  
Body of Message Begins

```

"body": [
  {
    "type": "TextBlock",
    "text": "✅ Sales Order Confirmed",
    "weight": "Bolder",
    "size": "Large",
    "color": "Good"
  },
  {
    "type": "FactSet",
    "facts": [
      {
        "title": "Order Number:",
        "value": "@{outputs('Get_a_row_by_ID')['body/mserp_salesordernumber']}"
      },
      {
        "title": "Customer Name:",
        "value": "@{triggerOutputs()['body/mserp_salesordername']}"
      },
      {
        "title": "Total Amount:",
        "value": "@{outputs('Get_a_row_by_ID')['body/mserp_ordertotalamount']}"
      },
      {
        "title": "Currency:",
        "value": "@{outputs('Get_a_row_by_ID')['body/mserp_currencycode']}"
      },
      {
        "title": "Requested Delivery Date:",
        "value": "@{outputs('Get_a_row_by_ID')['body/mserp_requestedshippingdate']}"
      }
    ]
  }
],
"actions": [],
"$schema": "http://adaptivecards.io/schemas/adaptive-card.json",
"version": "1.4"
}

```

**Type: TextBlock, it displays the text as written. The Width size and color attribute of the text**

**Type: FactSet, it displays the Label and value as present in the table**

Viola, the flow is ready. Let us Save the same and test.

The sales order is created in D365 FO in the same environment linked to Dataverse. The expected output is that when we confirm the sales order, the message should be displayed to all the Sales users regarding the confirmation of Sales Order.

Sales order Details on Teams

## Extension of the above case

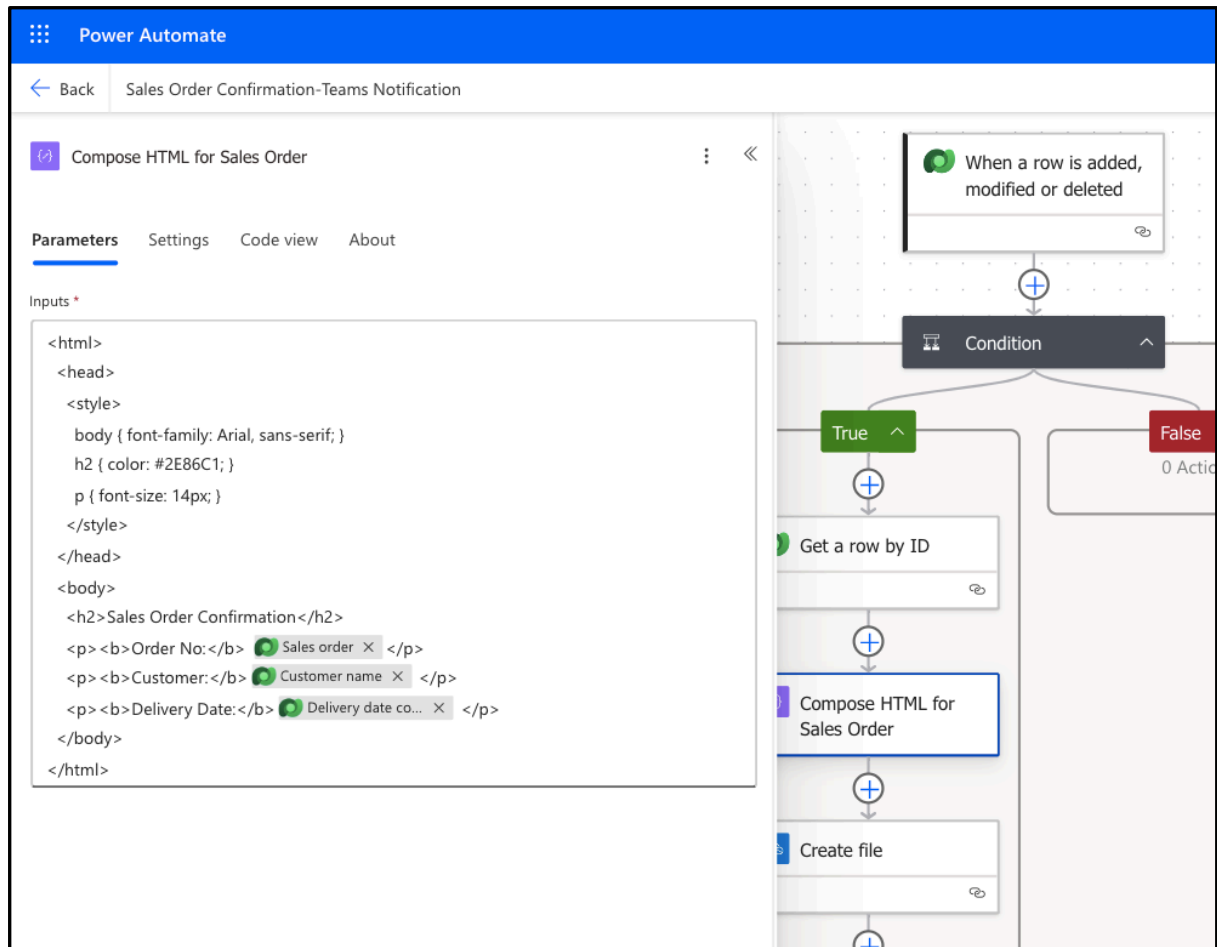

If we want the pdf to be generated for the confirmed Sales Order, and the same should also be uploaded on One Drive and be attached in the teams message. For this few more elements must be added which will perform the below actions: -

Once Sales order is filtered → Generate a HTML → Upload it to one Drive → Create a PDF from HTML → Upload the same also on OneDrive → Put the Web URL in the Adaptive card

1. **Compose HTML for Sales Order:** The order details generated in the step (Get a row by ID) can be designed as an HTML using the action **compose**

```
<html>
<head>
  <style>
    body { font-family: Arial, sans-serif; }
    h2 { color: #2E86C1; }
    p { font-size: 14px; }
  </style>
</head>
<body>
  <h2>Sales Order Confirmation</h2>
  <p><b>Order No:</b> @outputs('Get_a_row_by_ID')?['body/mserp_salesordernumber']</p>
  <p><b>Customer:</b> @outputs('Get_a_row_by_ID')?['body/mserp_salesordername']</p>
  <p><b>Delivery Date:</b> @outputs('Get_a_row_by_ID')?['body/mserp_salesorderpromisingmethod']</p>
</body>
</html>
```

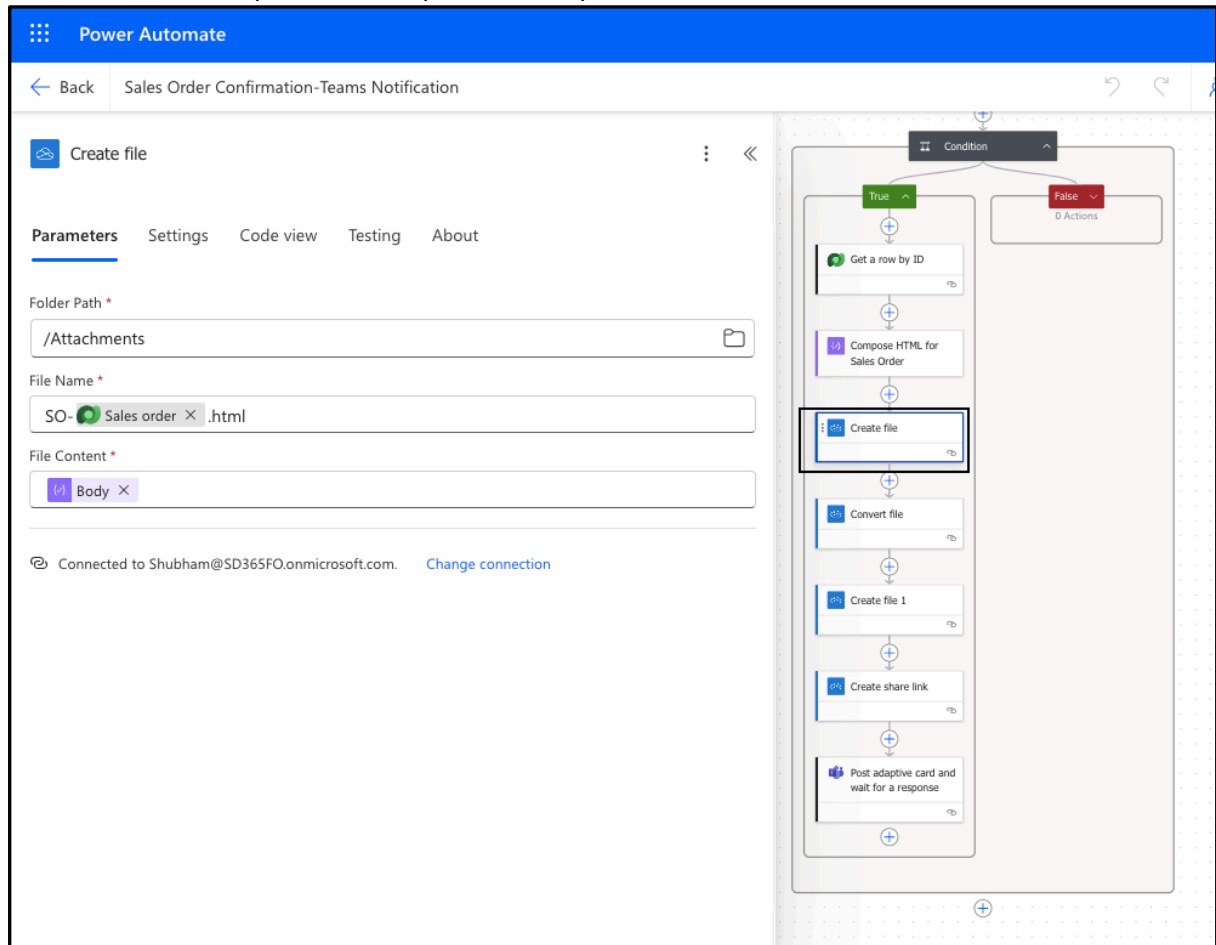

#represents the header of HTML document

#SO number

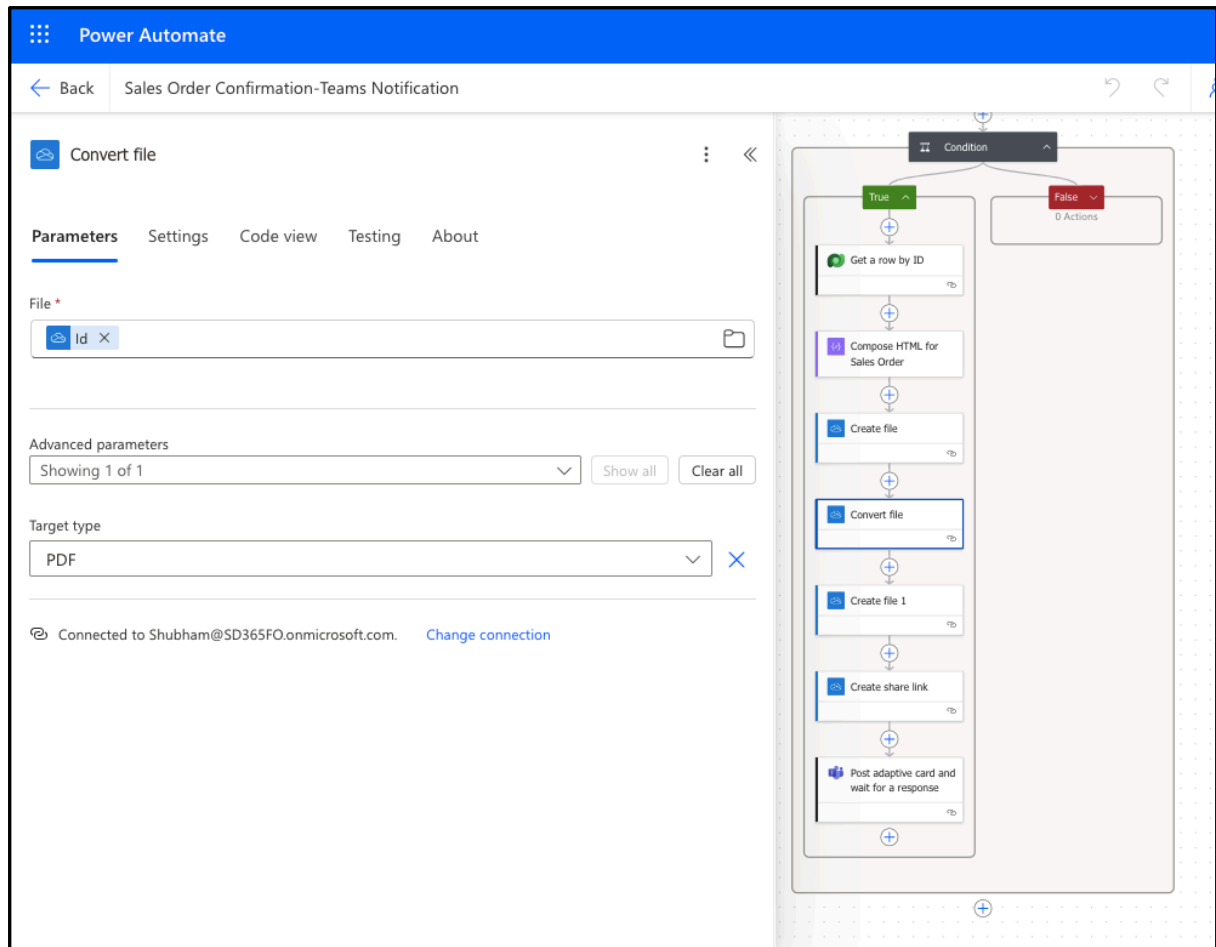

#SO Name

#Delivery Date

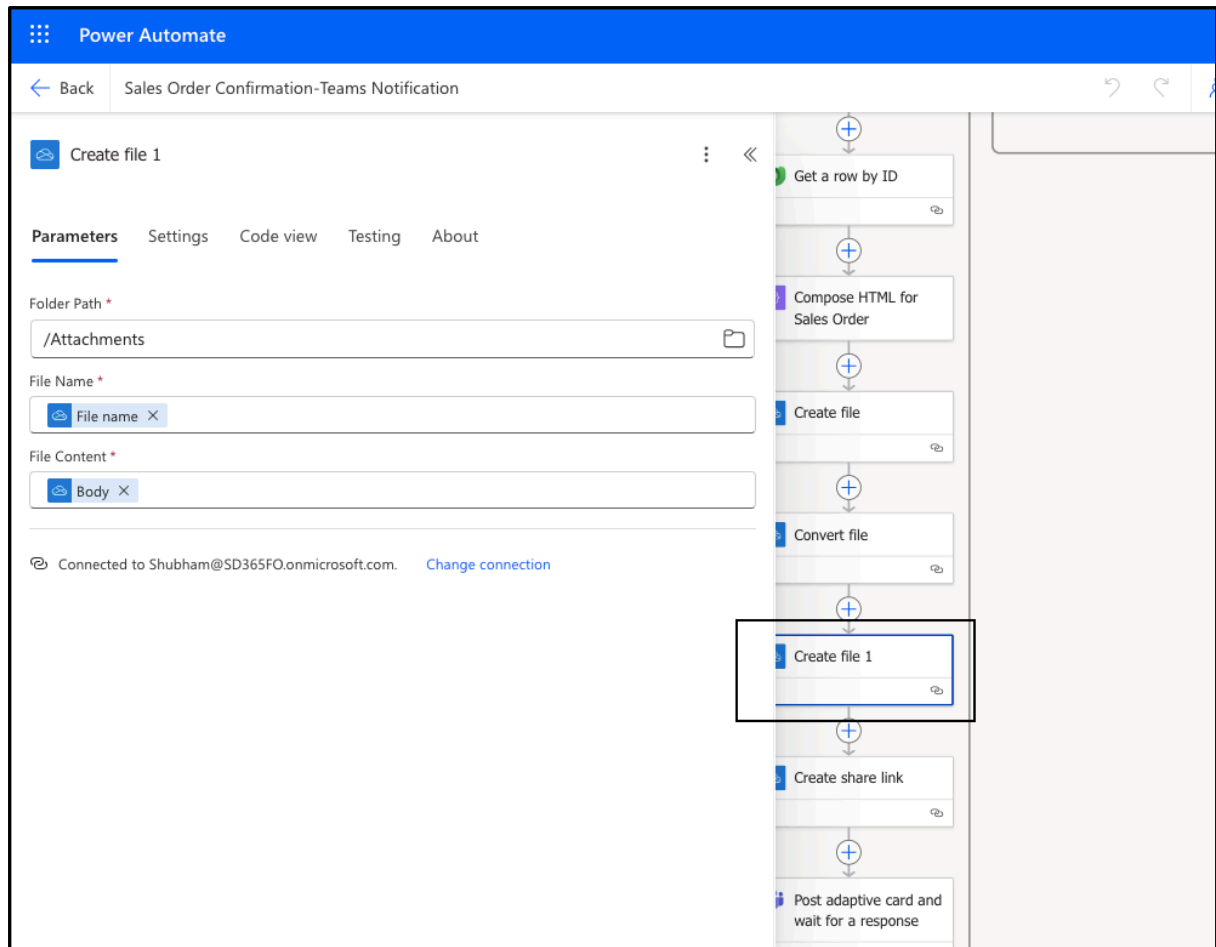

2. **Create a File:** Define the path of the folder in which the HTML will be uploaded, the file name. The File content will be the same as the body composed in the previous step.

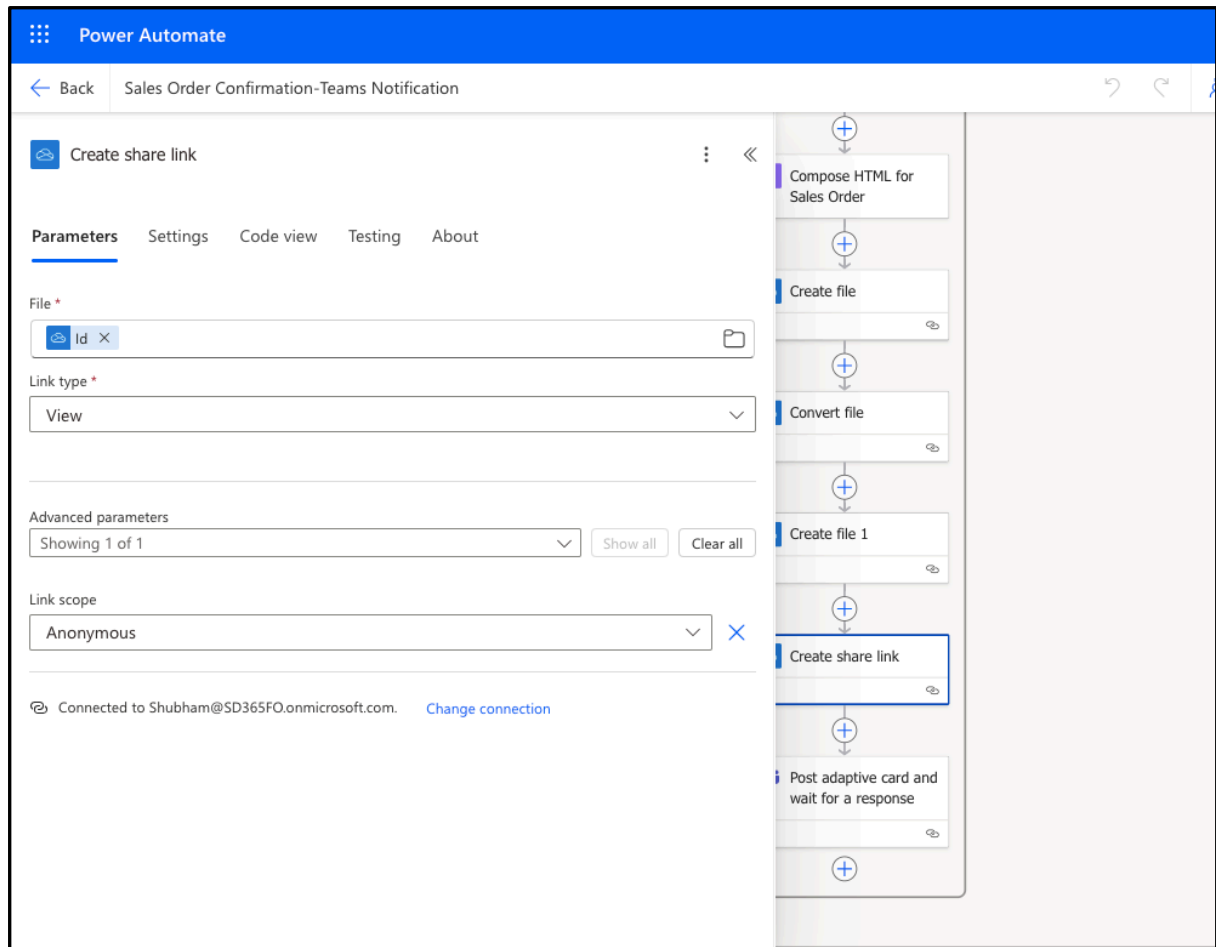

3. **Convert the File:** We will convert the HTML to PDF using this action. (This will require a premium subscription of Power Automate). In the File section select the file created in the previous step and select the target type as PDF.

4. **Create file:** The PDF created will be uploaded on the One Drive again under the Folder path specified. The File name and content will be the same created in the previous conversion step

5. Create a web link of the file which will be appended to the Adaptive card.  
File: ID which is the Unique identifier of file/folder created in previous step  
Link type: Can be View or Edit  
Link Scope: Organization(people in organization can see) or  
Anonymous(anyone can see)

The last step is to attach the web link on the adaptive card.

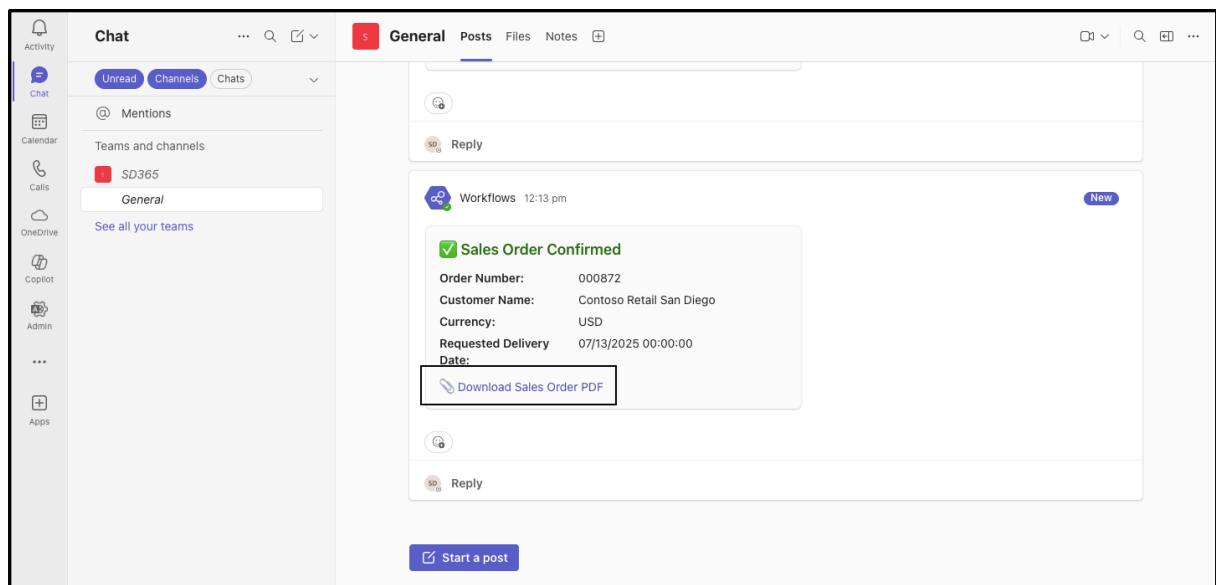

```
{
  "type": "AdaptiveCard",
  "body": [
    {
      "type": "TextBlock",
      "text": "✅ Sales Order Confirmed",
      "weight": "Bolder",
      "size": "Large",
      "color": "Good"
    },
    {
      "type": "FactSet",
      "facts": [
        {
          "title": "Order Number:",
          "value": "@{outputs('Get_a_row_by_ID')['body/mserp_salesordernumber']}"
        },
        {
          "title": "Customer Name:",
          "value": "@{triggerOutputs()['body/mserp_salesordername']}"
        }
      ]
    }
  ]
}
```

```

    },
    {
      "title": "Currency:",
      "value": "@{outputs('Get_a_row_by_ID')['body/mserp_currencycode']}"
    },
    {
      "title": "Requested Delivery Date:",
      "value": "@{outputs('Get_a_row_by_ID')['body/mserp_requestedshippingdate']}"
    }
  ]
},
{
  "type": "TextBlock",
  "text": "[📎 Download Sales Order  
PDF](@{outputs('Create_share_link')['body/WebRequest']}"),
  "wrap": true,
  "color": "Accent"
}
],
"actions": [],
"$schema": "http://adaptivecards.io/schemas/adaptive-card.json",
"version": "1.4"
}

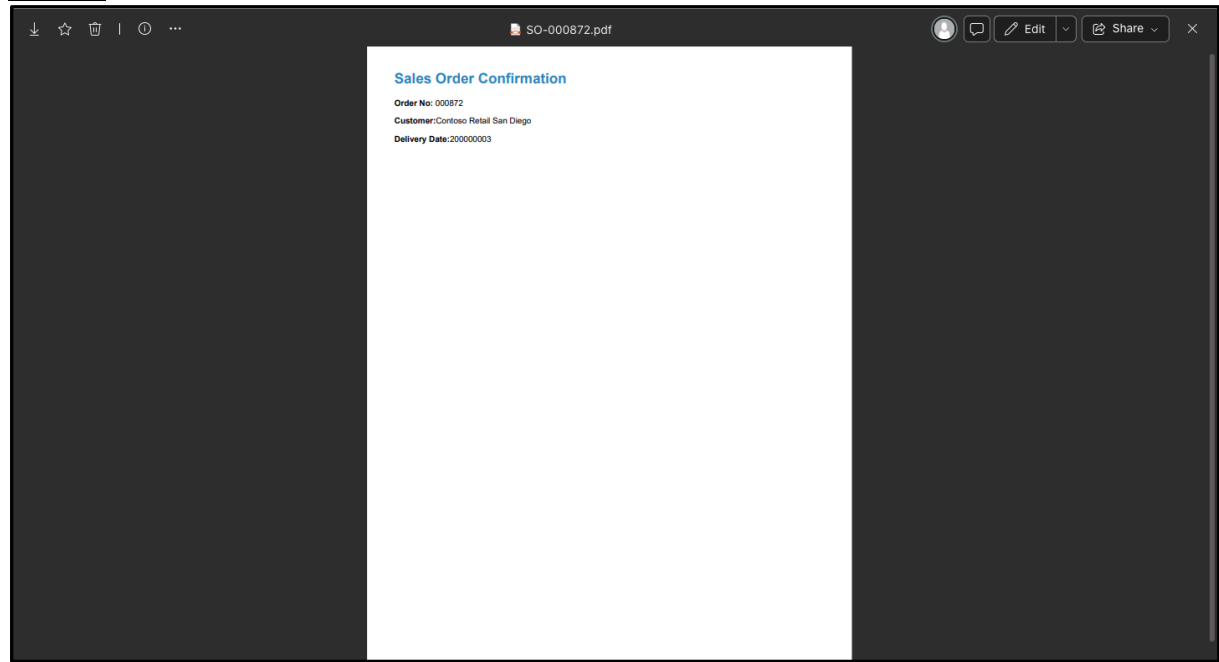

```

## Result

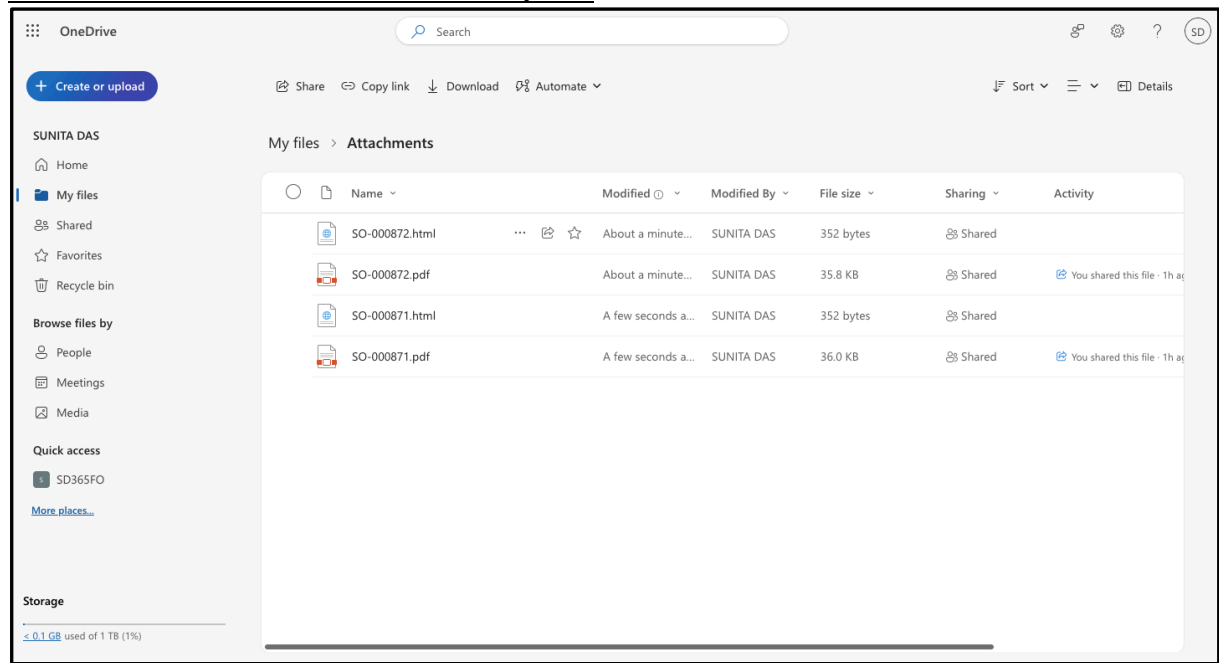

The link is available which can be used to see the details of the Sales Order at the time of confirmation.

## Sample

## The same is also available on the sharepoint

- Teams message sent automatically upon sales order confirmation
- Direct link to a PDF copy of the order for quick access
- Enables real-time tracking and downstream actions
- Link visibility scoped to the organization

**This solution demonstrates how Dataverse + Power Automate + Teams can replace manual notification processes with smart automation. It supports scalable collaboration in modern D365 projects and is easily extendable to include attachments, approval workflows, or customer notifications.**
