

Electronic Reporting (ER) in Dynamics 365 Finance and Operations (D365FO) is a no-code tool that empowers business users to design, generate, and customize electronic documents like invoices, tax reports, and payment files—without needing developer help.

What Makes ER So Useful?

- 1. No Coding Needed:** Business users can configure reports and formats.
 - 2. Supports Multiple Formats:** Excel, PDF, XML, CSV, etc.
 - 3. Legal Compliance:** Keeps your documents aligned with local regulations.
 - 4. Reusable Models:** Use the same setup across multiple reports.
-

Key Components of ER

- 1. Data Sources:** Where your data lives (Tables or Entities in D365FO).
- 2. Data Model:** Think of this as a blueprint that structures your data for reporting.
- 3. Model Mapping:** Maps system data to your data model.
- 4. Format:** The final report layout (Excel, XML, etc.)
- 5. Format Mapping:** Connects the model to the layout (What goes where in your report)

Image Reference: This visual shows how ER works from data source to output format in a single glance.

How to Get Started with ER?

1. Go to **Organization administration > Workspaces > Electronic reporting**
2. Set up a **Configuration Provider** (usually your company name)

3. Import existing templates from Lifecycle Services (LCS)

4. Customize them as per your needs

Real-World Example: Customizing a Sales Invoice Report

Let's say you want to change how your Sales Invoice looks. Here's the quick process:

1. Create a Derived Configuration: Start from Microsoft's base config and derive your own.

2. Download and Edit the Excel Template: Add logos, change layout, or add new fields (like customer name, invoice date, etc.).

3. Name the Fields: Use Excel's Name Box (above cell A1) to define fields that map to data.

4. Upload and Map the Fields: Go back to ER designer, upload the Excel file, and map each field to data in D365FO.

Import

Import from Excel
Update from Excel

Sales invoice: Excel = "Sales Invoice [redacted]"

Attachments

Type: Report

Name: Sales invoice

Respect pictures scaling: No

Template: Sales Invoice (Excel) [redacted]

Adjust row height: Default

LANGUAGE SETTINGS

Language preferences: Defined at run-time

Language: [redacted]

CULTURE SETTINGS

Culture preferences: Defined at run-time

Date, time, and number format: [redacted]

FORMATTING PREFERENCES

Update from Excel

Parameters

Template: Sales Invoice (Excel) [redacted]

Create Excel Sheet format element: Yes

Apply Excel data types for cell co...: No

Update Excel Header and Excel F...: No

OK Cancel

5. Validate and Save: Once mapping is done, validate and save your report layout.

6. Set in Print Management: Make your custom invoice the default one used by the system.

Output Options: Send It Where You Want

With **ER Destinations**, you can route your output to:

1. Screen
2. Email
3. SharePoint
4. Local File

Just go to: Organization administration > Electronic reporting > Electronic reporting destination

Generate Your First Custom Sales Invoice

Once you've completed the steps:

1. Go to **All Sales Orders**
2. Open any **invoiced sales order**
3. Choose **Print > Use print management**

Your **custom Excel-based Sales Invoice** will now be generated, ready to impress both internal teams and customers.
