

In Microsoft Dynamics 365 for Finance and Operations, **Point-in-Time Restore (PITR)** is a powerful feature that allows you to **restore the production database to a previous state** — useful when critical data is lost or an unintended change needs to be rolled back.

Here's a **step-by-step guide** on how it works:

How Point-in-Time Restore (PITR) Works in D365FO

1. Identify the Target Restore Time

Determine the **exact date and time** you want to revert the environment to. You can typically go back **up to 28 days**, with backups available in **5-minute intervals**.

2. Navigate to Your Production Environment

Go to **Lifecycle Services (LCS)** and open the **Environment Details** page of your production instance.

3. Initiate the Restore Process

- Click on **"Maintain"**
- Select **"Move database"**
- Choose **"Point-in-time restore"**

4. Select the Restore Point

From the list of available backup points, choose the one that best matches the moment before the undesired change or data loss occurred.

5. Review Warnings and Exclusions

- LCS will notify you of **any limitations** — such as data that won't be carried over.
- **Post-restore data** (after the selected point) will be lost, so it's critical to assess what's at stake.

6. Confirm and Launch the Restore

Once you confirm, the restore process kicks off. Expect **downtime** during this operation — so plan accordingly and inform stakeholders
