

D365 Finance & Operation Environment Guidelines

D365FO Environments
Pre Go-live
VS
Post Go-live

D365FO Environment Types & Common Insight

Standard Subscripted: Included in the standard offer, Microsoft manages this environment within its initial subscription. It encompasses both the production environment and a Tier-2 Standard Acceptance Test environment.

Supplementary: The additional environments are within a Microsoft-managed subscription that the customer has bought beyond the standard package. For instance, an add-on environment could be an extra Tier-4 setup for performance testing. Sizes range from Tier 2 to Tier 5, depending on resource requirements.

Cloud-hosted: These environments are supplementary settings managed by the customer or partner within a Microsoft Azure

subscription. Often known as Tier-1 environments, each developer receives their own cloud-hosted environment for development activities.

Geography: An area of the world containing at least one Azure region. Geographies define a discrete market that preserves data residency and compliance boundaries.

Region: A specific datacenter region where Dynamics 365 or Power Platform application runs or where the data is stored.

Datacenter: Azure datacenters are unique physical buildings that house a group of networked computer servers.

Product availability: Regions where Dynamics 365 applications can be deployed are available on the international availability of Dynamics 365 page.

Subscription: Agreement with Microsoft to use cloud platforms or services.

Licenses: Allows a specific user to use the service of a cloud offering or must assign the licenses to each user.

Tenant: A tenant represents an organization in Entra ID. Every Entra ID tenant is distinct and separate from other Entra ID tenants.

Environment Topology and Purpose: Describes the structure of the environment and its overall objective.

Environment Tier: Denotes the classification of the environment.

Cross-apps implementation: Cross-app implementations include finance and operations apps, Customer Engagement apps, and Power Apps. Cross-app implementations require understanding the

environment concepts, deployment options, integration, extension, application lifecycle management, security models, and licensing for finance and operations apps, Customer Engagement apps, and Microsoft Power Platform solutions.

Available Environments & Compatibility with Deployment

Deploying Microsoft Dynamics 365 Finance and Operations requires careful planning of the necessary environments. The number of environments depends on project complexity and scope, typically needing several key setups.

Environment purpose	Tier	Std. subscription	Less complex	More complex
Production	Sized	●	●	●
Test / Training	Tier-2	●	●	●
Development	Tier-1		●	●
Build	Tier-1*		●	●
Golden Configuration	Tier-1 or 2		●	●
Data migration	Tier-2 or higher		●	●
Performance testing	Tier-4 or 5		●	●
Training	Tier-2 or 3			●
System Integration Testing	Tier-2 or 3			●
Other / ad hoc	---			●

Choosing between VHD and cloud deployments [Tier 1]

Capability	Downloading a VHD	Cloud-hosted in customer subscription
Public URL	Not supported	OK
Integration development	Extra setup required	OK
Azure DevOps	Extra setup required	OK
Apply deployable package	Manual through runbooks	OK
Deploy data packages from LCS	Not supported	OK
Maintenance	Managed by customer/partner	Managed by customer/partner
Cost model	Hardware-related	Pay-as-you-go*

Choosing the appropriate Tier-2 or higher environment.

Select the deployment option; why?

cloud deployment	on-premises deployment
• Shorter deployment time. • More features less customization required. • Costs of IT hardware and software are lower. • Includes High Availability and Disaster Recovery functionality. • Includes sandbox environments, ALM, database storage, and file storage. • Automatic deployment, continuous updates, and elastic compute capacity are available. • Provides data aggregation, financial reporting, and intelligence • Advanced Analytics and Azure Machine learning are included.	• Existing datacenter investments can be leveraged, datacenters disconnected from the public cloud. • Customers can configure their enterprise preferences to meet the regulatory and compliance needs of their business. • Comply with data sovereignty rules where there are no Azure datacenters. • Ensure business continuity in areas with limited public infrastructure.

D365FO Environmental Strategy for Implementation and Post Go-live.

Supposition

Secure D365FO environments for development, testing, and maintenance to ensure production stability and reliability.

I hope this information helps -Thanks you.
