

Let's say in D365FO you are in the Budget Register Entry form (or any other form in the interface), you need to know what table(s) are used to populate a form. There are multiple ways to find the main table or list of tables. Below are several ways to find tables for the form.

Examples:

1. **Record Info** - In the Options tab in the Page Options section click the Record Info button.

This will open a panel on screen; click the Show All Fields button. Now scroll to the bottom of the page, you will see a field labeled TableID.

You can take this number, open SQL Management Studio and run a similar select query as shown below. **Note:** your TableId may be different than is shown below.

SELECT * FROM TABLEIDTABLE WHERE ID = 7733

Results		Messages		
	ID	NAME	RECVERSION	RECID
1	7733	BudgetTransactionHeader	1	7733

This is the main table for this list page. **Note:** there may be other tables that make up the form. You can see what tables have relations to this table in Visual Studio. Find the Budget Transaction header, expand the relations section. This will only show tables this table ties to but does not show other tables that tie to this table.

2. **Form Info - Data Source:** When you are in the form, you can right-click. This will bring up a menu list; you will want to select Form Information – and select the Form Name.

This will open a new panel on the page, if you scroll down to the Control Information section, you will see a field labeled Data Source. **Note:** in some instances, the Data Source may be blank.

This field tells you the main table, in this case it is the BudgetTransactionHeader. This is the same table that we saw in the RecordInfo form from example 1.

3. **Form Info – Query Statement:** You will access the Form Information panel like you did in example 2, but this time we are looking at the Query Statement field near the bottom of the panel.

Query statement

```
Query object 899f6330:  
SELECT FIRSTFAST  
FORUPDATE * FROM  
BudgetTransactionHeader(B  
udgetTransactionHeader)
```

You can select and copy the query, then paste it into SQL Management Studio.

```
Query object 899f6330: SELECT FIRSTFAST FORUPDATE *  
FROM BudgetTransactionHeader(BudgetTransactionHeader) USING INDEX TransactionNumberIdx WHERE ((PrimaryLedger = 22565420920))  
JOIN FORUPDATE * FROM BudgetTransactionHeaderView(BudgetTransactionHeaderView)  
ON BudgetTransactionHeader.RecId = BudgetTransactionHeaderView.RecId  
OUTER JOIN FORUPDATE Name FROM BudgetTransactionCode(Ref_BudgetTransactionCode_BudgetTransactionCode)  
ON BudgetTransactionHeader.BudgetTransactionCode = BudgetTransactionCode.RecId  
OUTER JOIN FORUPDATE Name, Name FROM Ledger(Ref_BudgetTransactionHeader_PrimaryLedger_PrimaryLedger)  
ON BudgetTransactionHeader.PrimaryLedger = Ledger.RecId
```

Note: This query will not run, you will need to modify the query, to something that looks like the query below.

```
SELECT * FROM BudgetTransactionHeader BTH  
JOIN BudgetTransactionHeaderView BTHV ON BTH.RecId = BTHV.RecId  
LEFT JOIN BudgetTransactionCode BTC ON BTH.BudgetTransactionCode = BTC.RecId  
LEFT JOIN Ledger L ON BTH.PrimaryLedger = L.RecId  
WHERE BTH.PRIMARYLEDGER = 22565420920
```

4. **Visual Studio – Menu Item:** The Menu Item can be found in the URL of the interface once you are on the form. In this case we are in the Budget Register Entry form. The Menu Item shows Budget Transactions.

1/?cmp=USMF&mi=BudgetTransactions

In Visual Studio type of paste the name of the Menu Item into the filter of the Application Explorer. You will see a section show: User Interface next level down is Menu Items as shown in the screenshot below.

Right-click on the BudgetTransactions item and select View Designer. When the tab opens right-click on Go To Form BudgetTransaction

This will open a copy of the form. In the upper left box, you will see BudgetTransaction and below that you will see Data Sources. Expand the Data Sources.

You will see that there are 3 data sources. **Note:** one data source is a View(views will be covered in another document).

5. **D365FO Trace** – If you are signed in as the System Admin you can capture a trace, the trace will show you the code and tables used in the process you did while the trace was running. Once the trace is stopped, you can open the file in

the Trace Parser. You will select the user from the drop down and select the SQL tab.

Below is an example of what Trace Parser looks like.

The screenshot shows the Trace Parser interface. At the top, there is a 'Select Grouping' dropdown menu with the value '[cloudslice.onmicrosoft.com][1@3264@@{F93D1627-8866-440D-BADA}']'. Below this is a tabbed interface with 'Timeline', 'Overview', 'Call Tree', and 'SQL' tabs. The 'SQL' tab is selected. Below the tabs is a 'Name Filter' input field. There are two checkboxes: 'Show Aggregate' (checked) and 'Show Tables' (checked). Below these is a table with the following columns: 'Name', 'Count', 'Inclusive Total (ms)', 'Inclusive Average (ms)', and 'Exclusive Total (ms)'. The table contains the following data:

Name	Count	Inclusive Total (ms)	Inclusive Average (ms)	Exclusive Total (ms)
BUDGETTRANSACTIONHEADER	4	1.58	0.40	1.47
BUDGETTRANSACTIONLINE	2	38.83	19.42	38.73
BUDGETTRANSACTIONLINE	1	67.61	67.61	67.54
BUDGETTRANSACTIONLINE	1	8.55	8.55	8.50
FORMCONTROLREACTGRIDSTATE	5	1.79	0.36	1.67
FORMRUNCONFIGURATIONUSERWORKSPACE	1	3.89	3.89	3.82
POWERAUTOMATECONFIG	1	0.52	0.52	0.52

You can see there are 3 BudgetTransaction tables shown.

Note:

Some of the examples above may only show one of the tables. You may need to do more investigating to find other tables that are used. I usually will use one or more examples to find all the data I am looking for.

There might be other ways to find tables that are not listed in this document.
